- Redundancy: Same data appearing multiple times

- Ex: Out of 21 variables, at least 18 of them are consistently repeating. This is taking too much storage space
- Multiple Themes: Having too much info/concepts in one row.
 - Ex: A given row tells us every single information we have to know about that specific line order, but we rarely want all the information at the same time. It's always better to divide variables into different tables
- Anomalies
 - Update Anomaly: If we wanted to update the category type of a specific product, we would have to make changes to every single product in this list and it would be very time consuming.
 - Deletion Anomaly: If we want to remove a specific order from the list, it would end up deleting every information related to this order where some columns might be needed for future use.

- Insertion Anomaly: If we want to add a new city and country to the list of countries that have a participating market, there would be NULL values for every other column because an order hasn't taken place.

Relational Database helps solve all of these issues by dividing variables into different tables, while ensuring that the relationships between tables exist. This helps connect all of the tables and variables between each other. The next step would be to identify the Functional Dependencies (Value of 1 or more attributes helps find another attribute) for the purpose of Data Normalization. This is the process to make sure the relational database is well informed and is not susceptible to data anomalies.

Functional Dependencies:

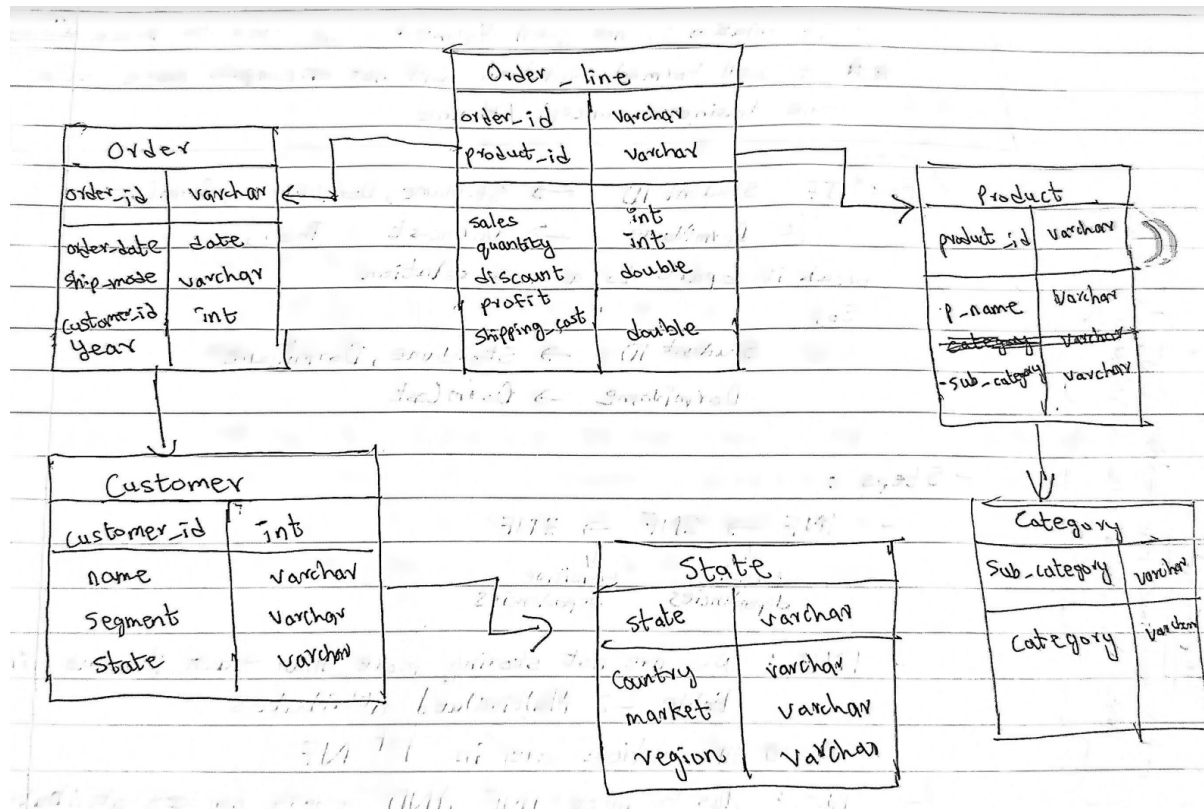

- Every determinant should be a candidate key (has the potential to become a primary key).
- If a relation is not well formed, we need to break into multiple tables.
- A well informed relation will not encompass more than one business concept/theme
- Steps to complete this process: 1NF => 2NF => 3NF
 - 1NF: Do not store more than 1 value in a table (Multivalued attributes)
 - 2NF: Has to meet 1NF AND every non key attribute must be dependent on the primary key. No partial dependencies.
 - 3NF: PK determinant for another attribute but that attribute is determinant for another attribute. This is a transitive dependency so, we break it into smaller relations.

From all the variables in the google sheet, the following functional dependencies were created to create a relationship between every variable:

- {order_id} ⇒ {customer_id, first_name, last_name, state, country, segment, market, region, ship_date, ship_mode, order_date, order_priority, year}
- {customer_id} ⇒ {first_name, last_name, state, country, segment, market, region}
- {state} ⇒ {country, market, region}
- {country} ⇒ {market}
- {product_id} ⇒ {product_name, category, sub_category}
- {sub_category} ⇒ {category}
- {order_id, product_id} ⇒ {sales, quantity, discount, profit, shipping cost}

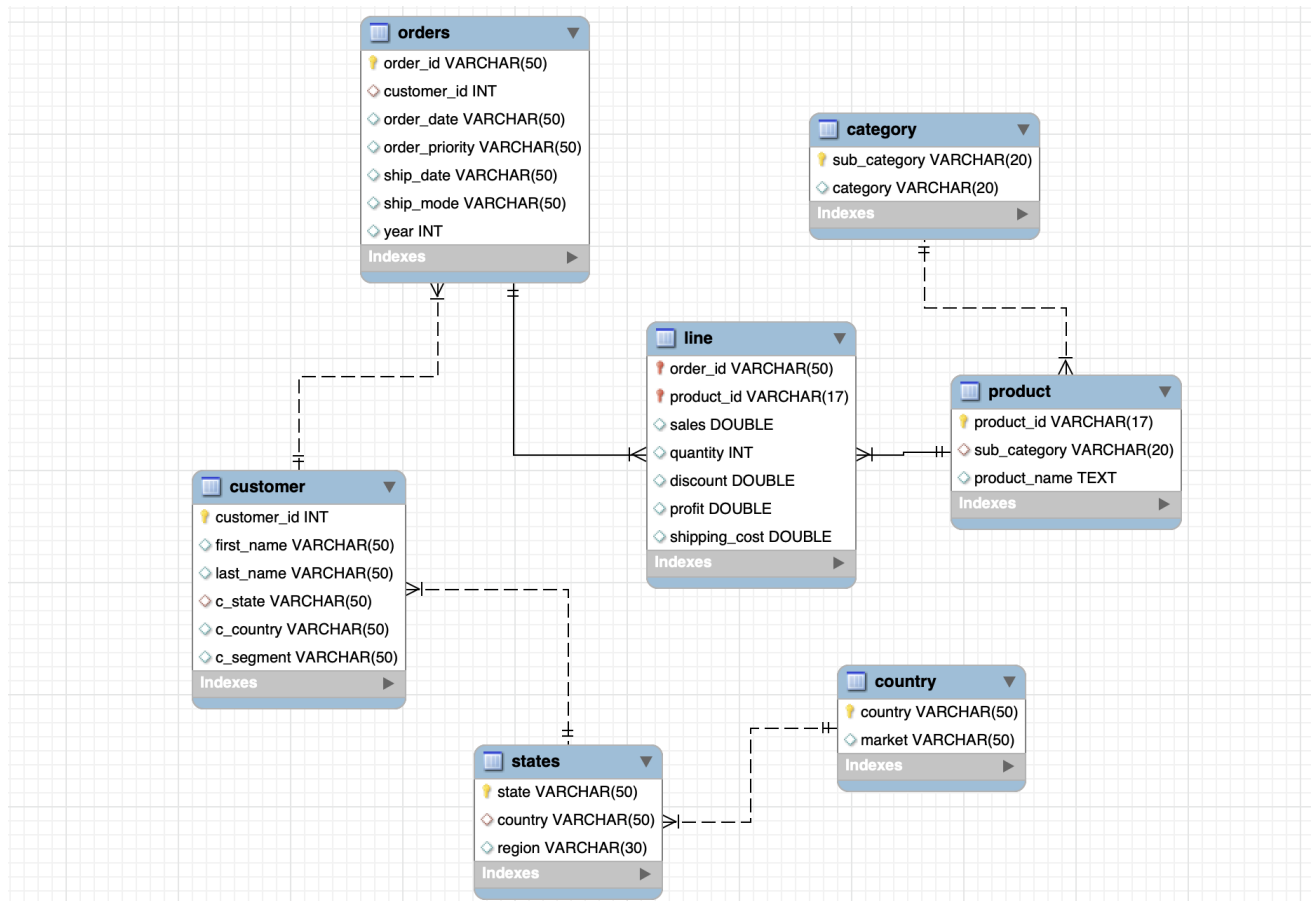

Data Normalization

The following is my initial take on Data Normalization to showcase the relationships between each table:

ER Diagram

The next step would be to create a well functioning ER Diagram by identifying the primary and foreign keys for each table. The following ER Diagram shows all the properties for every table, and how it creates a well formed relational database.

Things to add to this document:

- How Customer ID was created
- How each table was separately made in Excel before converting to csv files for importing in MySQL
- Link to that Spreadsheet to show the preliminary table

Visual Representation of Tables

For visual purposes, I have provided the images for the first 10 values for each table below through querying in MySQL Workbench.

Category Table:

sub_category	category
Accessories	Technology
Appliances	Office Supplies
Art	Office Supplies
Binders	Office Supplies
Bookcases	Furniture
Chairs	Furniture
Copiers	Technology
Envelopes	Office Supplies
Fasteners	Office Supplies
Furnishings	Furniture
NULL	NULL

Country Table:

country	market
Afghanistan	APAC
Albania	EMEA
Algeria	Africa
Angola	Africa
Argentina	LATAM
Armenia	EMEA
Australia	APAC
Austria	EU
Azerbaijan	EMEA
Bahrain	EMEA
NULL	NULL

Line Table:

order_id	product_id	sales	quantity	discount	profit	shipping_co...
AE-2011-9160	OFF-FEL-10001405	82.674	2	0.7	-157.086	5.69
